Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This amino acid sequence represents the heavy chain of humanised anti-
CD23 (FCERII) monoclonal antibody C11, composed of a human framework
(HSIGKVII) and the heavy chain complementarity determining regions (see
AV22257-59) of murine antibody C11. The DNA was constructed by splice
overlap PCR. The invention provides altered antibodies, such as chimeric
or humanised antibodies, which comprise sufficient of the amino acid
sequences of the C11 light and heavy chain complementarity determining
regions to render them capable of binding to the CD23 type II molecule
expressed on haematopoietic cells. The antibodies are used to block
soluble CD23 formation in human therapy, for the treatment of arthritis,
lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis,
diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome,
clomerallonephritis, inflammantory bowel disease, ulcerative colitis,
crohn's disease, Sjogren's syndrome, allergic asthma,
intrinsic asthma, acute asthmatic exacerbation, rhinitis, eczema,
thrinsic asthma, acute asthmatic exacerbation, rhinitis, and B-cell
malignancies (claimed). They are also useful for studying interactions
between CD23 and various ligands and determining the binding agents

```

bBV-transformed cell lines and mouse-human heterohybridomas producing human MAbs specific for the gpl20 V3 loop of HIV-1 NN isolate were obtained. WAb 447-52D was found to recognise the tetrapeptide motif GPGR, i.e. the Principal Neutralising Determinant common to the V3 loop of different HIV isolates. A recombinant Ab was produced in which the H chain intronic sequence are appended, fused to a fragment contg. a short intronic sequence are appended, fused to a fragment contg. a short intronic segment of the human gamma 1 cregion and the human gamma 1 encoding domain in its genomic form. (Updated on 25-MAR-2003 to correct PN field.)

```
The present invention relates to novel antibodies that specifically bind to very late activation (VLA-1; betal containing integrins) antigens and methods of using these antibodies to treat immunological disorders. The cati-VLA-1 antibodies are useful for preventing or treating VLA-1-CC mediated immunological or inflammatory disorders such as skin related conditions (e.g. psoriasis, eczema, burns, dermatitis and abnormal conditions (e.g. psoriasis, eczema, burns, dermatitis and abnormal compositis, tendonitis, respiratory distress syndrome, asthma, bronchitis, tendonitis, bursitis, fever, migraine headaches, gastro-concential conditions (e.g. inflammatory bowel disease, Crohn's disease, crohnist intrable bowel syndrome, colitis and colorectal cancer).

Contonimum diseases (e.g. atherosclerosis), thyroiditis, aplastic anaemia, periarteritis nodosa, Hodgkin's disease, rheumatic fever, osteoarthritis, operiarteritis nodosa, Hodgkin's disease, rheumatic fever, osteoarthritis, carchides systemic lupus erythemacous and multiple sclerosis), renal failure, sarcoidosis, nephrotic syndrome, Behcet's syndrome, gingivitis, crimmediate hypersensitivity (e.g. delayed type hypersensitivity or immediate hypersensitivity), graft and transplant rejections, graft correctial isofamemia or endotoxin shock syndrome. The present sequence is hower where the syndrome is the present sequence is
                                                                                                                                                                                                                                                                   New anti-VLA-1 antibodies are useful for preventing or treating VLA-1-mediated immunological or inflammatory disorders, e.g. psoriasis, eczema, burns, dermatitis, and abnormal proliferation of hair follicle cells or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 GluValGlnLeuValGluSerGlyGlyGlyLeuValGlnFroGlyGlySerLeuArgLeu

The present sequence is that of a preferred heavy chain of a humanised antibody of the present invention. In the variable region of this sequence, the complementarity determining regions (CDRs) originate from murine monoclonal antibody 3D6 and the framework region originates from human germilate Wh segment DP-45 and 4D segment JM4 Novel humanised antibodies of the invention have CDRs from 3D6 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 3D6 antibody. The invention includes antibodies, single chain antibodies, and their fragments, as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical cerebral amyloid angiopathy, and to inhibit formation or reduce Abeta plaque in the brain. (Updated on 23-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                              Monoclonal antibody; 3D6; complementarity determining region; CDR; mouse; human; humanised antibody; antibody; Alzheimer's disease; Down's syndrome; cerebral amyloid angiopathy; neuroprotective; nootropic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New humanized forms of mouse 3D6 antibodies, useful for treating Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical cerebral amyloid angiopathy, or for inhibiting formation of or reducing Abeta plaque in the brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1. .119 /note= "heavy chain variable region"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ð
                                                                     ð
                                                                                                                       The present sequence is that of a preferred heavy chain of a humanised antibody of the present invention. In the variable region of this sequence, the complementarity determining regions (CDRs) originate from murine monoclonal antibody 3D6 and the framework region from human germline VH segment DP-45 and J segment JH4. Novel humanised antibodies of the invention have CDRs from 3D6 and human framework sequences. These humanised antibodies have binding affinities (affinity and epicope location) approximately the same as those of the mouse 3D6 antibody. The invention includes antibodies, single chain antibodies, and their calls, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical cerebral amyloid angiopathy, and to inhibit formation or reduce Abeta plaque in the brain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ACCAAGGGCCCATCGGTCTTCCCCCTGGCACCTCCTAAGAGCACCTCTGGGGGCACA 408
                                                                                                                                                                               The invention relates to a compound comprising CD44 specific antibody molecule conjugated to a highly cytotoxic drug, which cleaves under intracellular conditions. The compound is used in pharmaceutical composition for the treatment of cancer, solid tumours, and as an adjuvant to surgical intervention to treat minimal residual disease. The present sequence is humanised murine antibody BIWA4 heavy chain protein used in the invention
                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                      50

                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel antibody molecules comprising a variable region of the heavy (WH) and/or light chain (VL) of CD44v6 specific humanised antibody called BTWAR and BTWAR. Sequences of the invention are useful for manufacturing a medicament and for treating cancer including colorectum, non-small cell lung, breast, head and neck, ovarian, lung, bladder, pancreatic cancer or metastatic cancers of the brain. They are also useful in antibody therapy. The present sequence is BTWA4/8 antibody heavy chain mauure protein. This sequence is used in the exemplification of the invention

New anti-VLA-1 antibodies are useful for preventing or treating VLA-1-mediated immunological or inflammatory disorders, e.g. psoriasis, eczema, burns, dermatitis, and abnormal proliferation of hair follicle cells or fibrosis.

Example 23; Page 91-92; 248pp; English.

The present invention relates to novel antibodies that specifically bind to very late activation (VLA-1; betal containing integrins) antigens and methodis of using these antibodies to treat immunological disorders. The anti-VLA-1 antibodies are useful for preventing or treating VLA-1 antibodies are useful and proliferation of hair follicle cells), fibrosis (e.g. kidney or lung fibrosis), allergic rhinitis, prespiratory distress syndrome, asthma, bronditions (e.g. inflammatory bowel disease, Crohn's disease, checking and colorectal cancel), tratable bowel syndrome, colitis and colorectal cancel), periatteritis nodosa, Hodgkin's disease, rheumatic fever, osteoarthritis, systemic lupus erythematosus and multiple sclerosis), renal arthitis, systemic lupus erythematosus and multiple sclerosis), renal muson host disease, conjunctivitis, swelling occurring after injury, myocardial ischaemia or endotoxain shock syndrome. The present sequence is human AQC2 heavy chain mutant protein, haAQC2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to treating cognitive symptoms or reducing disease progression in a subject having a condition or disease associated with amyloid-beta peptide (Abeta). The method involves administering an amount of an anti-Abeta antibôdy that has greater affinity for soluble Abeta hinton 10°-9 M, that has affinity (KD) for soluble Abetal-42 higher than 10°-9 M, to that has greater affinity for soluble Abeta antibôdy 266 has. The method or the anti-Abeta antibôdy is useful in preparing a medicament for treating cognitive symptoms or reducing disease progression in a subject having a condition or disease associated with Abeta. The condition or disease is Alzheimer's disease, Down's syndrome, cerebral amyloid angiopathy, vascular dementia, or mild cognitive impairment. The present sequence represents a humanised anti-Abeta antibody 266 heavy chain

The method is useful for treating cognitive impairments associated with Abeta peptide including those involved in Alzheimer's disease, Down's syndrome, cerebral amyloid angiopathy, craim vascular dementia, and certain forms of mild cognitive impairment. The anti-Abeta antibody is useful for preparing a medicament for effecting rapid improvement in cognition in a subject having Alzheimer's disease, Down's syndrome, cerebral amyloid angiopathy, or mild cognitive impairment. The present sequence represents a preferred heavy chain for a humanised 266 antibody
                                                                                                                                                                                                                                                                                                                            20
